* Environment *

Have you ever noticed the drastic change in your surrounding environment? Before some decades people used to wake up by the sound of those small birds but, now a days we can hardly see them. Think about the probable reasons behind it.

Development is important no doubt but, don't you think that protection and conservation of our environment is also much essential not only for us but, also for other living organisms. We should try and understand the importance of greenery that is, trees in our life & take measures to conserve it. Development means improving the present situation but, without harming the environment. Today's weather conditions are due to drastic decrease in green cover that is forest area. Why is this green cover decreasing? It is because for constructing buildings, roads etc. we cut the trees. Oh, if we cut the trees to construct a

building, then after construction we can plant trees around it. This at least will provide you fresh air.

For making footpaths also people cut the beautiful and big trees at the road side. We can make a pit around the tree and construct the footpath and road from it's side. The point I am trying to convey is just that, if we can't plant new trees we should at least try to conserve the existing one.

Many people plant new trees but, only planting doesn't help it, we need to grow and take care of trees till it grows properly that is, gets mature or adult. Trees has high regeneration capacity. If a tree is cut by someone from its root then it can be replanted on other land.

Trees are the natural resources of environment which not only gives us oxygen but also plays a vital role in maintaining the balance of ecosystem. So, it is the responsibility of every mankind to protect & conserve it by maintaining greenary around your area. Conserve the environment then only you will be conserved.
